What African Americans with diabetes or high blood pressure need to know

GET CHECKED FOR KIDNEY DISEASE

NKDEP National Kidney Disease Education Program

A program of the National Institutes of Health

Why should I be checked for kidney disease?

Diabetes and high blood pressure are common health issues among African Americans. These conditions can damage the kidneys over time and may even cause kidney failure. Here are some other reasons to get checked:

■ **Early kidney disease has no signs or symptoms.** The only way to know if you have kidney disease is to get checked for it.

■ **Kidney disease usually does not go away.** It may get worse over time and can lead to kidney failure. If your kidneys fail, you may need to go on dialysis or have a kidney transplant to maintain health.

■ **Kidney disease can be treated.** The sooner you know you have kidney disease, the sooner you can start treatment to help delay or prevent kidney failure. Treating kidney disease also may help prevent heart disease.

FACTS

■ Diabetes is the #1 cause of kidney failure among African Americans. High blood pressure is the #2 cause.

■ African Americans have a higher rate of kidney failure than any other group of people.
What steps can I take to keep my kidneys healthy?

1. Get checked for kidney disease. The sooner you know you have kidney disease, the sooner it can be treated.

2. Manage your diabetes and keep your blood pressure at or below the target set by your health care provider. For most people, the blood pressure target is less than 140/90 mm Hg. Here's how:

   - Eat healthy
   - Cut back on salt
   - Be active
   - Take medicines as prescribed

Tell others about the Kidney Connection.

Help your family or faith community make the connection between kidney disease and its main risk factors: diabetes and high blood pressure. You don't have to be a health expert to talk to them about kidney health and the importance of getting checked. The National Kidney Disease Education Program's easy-to-use tools—the *Family Reunion Health Guide* and *Kidney Sundays* Toolkit—tell you how. Visit **www.nkdep.nih.gov** to view or order them.

KIDNEYS

You have two kidneys located near the middle of your back, just under your rib cage. Their main job is to filter wastes and extra water from the blood to make urine. Wastes can build up in the body when the kidneys are damaged.

You also should be checked for kidney disease if you have:

- Cardiovascular (heart) disease, or
- A mother, father, sister, or brother with kidney failure.

How will I be checked for kidney disease?

Two tests are used to check for kidney disease:

- A blood test checks your GFR, which tells how well your kidneys are filtering. GFR stands for glomerular (gloh–MAIR–yoo–lar) filtration rate.
- A urine test checks for albumin. Albumin is a protein that can pass into the urine when the kidneys are damaged.

At your next health care visit, make sure you learn:

Your blood pressure

Your GFR

The amount of albumin in your urine

Your blood glucose

or visit www.nkdep.nih.gov/resources.

Participants in clinical trials can play a more active role in their own health care, gain access to new research treatments before they are widely available, and help others by contributing to medical research. For more information, visit www.clinicaltrials.gov.

The National Kidney Disease Education Program (NKDEP) encourages people to get tested for kidney disease and educates those with kidney disease and their health care providers about treatments that can help delay or prevent kidney failure. NKDEP is a program of the National Institutes of Health (NIH).
